Corrosion Resistance of Austenite Steels After Pressure Working at Low Temperatures

the steel was less impaired and a maximum on the curve ("weight loss versus degree of compression") was not observed. After rolling at low temperature X-ray examinations of the phase composition in austenite steels were carried out to determine, to which amount of martensite corresponded the maximum decrease of corrosion resistance. Comparison of curves (Figures 2, 3) show a maximum weight loss in 1Kh18N9 steel after compression by 15 - 20%, which corresponded to about 50% martensite. If compression was increased up to 40%, corrosion resistance improved and then became almost equal to that of steel rolled at room temperature. Thus, after rolling at -183°C and 40% compression, the weight loss was 14 g/m<sup>2</sup> and after rolling at room temperature it was 11 g/m<sup>2</sup>. Improved corrosion resistance in the presence of a martensite content of over 50% in steel rolled at low temperatures, proved that high-alloy martensite ensured sufficiently high corrosion resistance.

The conclusion is drawn that in austenite steels with non-stable austenite, ✓

 TITLE On the rational-quadratic integral of the geodesic lines in  
spaces of affine connection.  
 PERIODICAL Mat. Sbornik, n. Ser. 36, 169-200 (1955)  
 reviewed 6/1956

CARD 1/3

PG - 104

In the first part of the paper the two-dimensional spaces  $A_2$  with affine connection are considered. The investigation bases essentially on the theory of the nets of non-metric spaces of affine connection given by Norden. Some theorems on the relations between rational quadratic integrals and different nets are given; e.g.: In order that

$$(1) \quad \frac{a_{ij} du^i du^j}{b_{ij} du^i du^j} = C$$

is an integral of the geodesic lines of the  $A_2$ , it is necessary and sufficient that the tensors  $a_{ij}$ ,  $b_{ij}$  and any linear combination of both represent geodesic nets in the  $A_2$ . The geodesic nets  $a_{ij} du^i du^j = 0$  and  $b_{ij} du^i du^j = 0$  are denoted as basis nets of the integral (1). In order that the geodesic lines of the  $A_2$  possess a first rational linear integral it is necessary and sufficient that in  $A_2$  there exist two geodesic nets the CesbySev vectors of which differ by the gradient of a function. These nets then are basis nets of the integral.

Mat. Sbornik, n. Ser. 36, 169-200 (1955)

CARD 2/3

PG - 104

Nets with the same Cebyshev vectors are called special nets. In order that (1) is an integral of the geodesic lines, where the ratio of the discriminants of  $a_{ij}$  and  $b_{ij}$  is constant,  $a_{ij}$  and  $b_{ij}$  must represent special nets which then are basis nets too. Then spaces of affine connection are sought the geodesic lines of which possess first integrals of the form (1). A generalization of the Darboux theorem on the geodesic mapping is proved: In order that the Weyl's space  $W_2$  admits a geodesic gradient mapping onto another  $W_2$ , it is necessary and sufficient that the geodesic lines of the  $W_2$  possess an integral (1), one basis net of which is an isotropic net of the given space  $W_2$ . Three special cases of the  $A_2$  which admit (1) are considered.

The second part of the paper relates to more-dimensional spaces of affine connection. As more-dimensional analogue of the quasi-euclidean spaces, reducible Weyl spaces are introduced, i.e. such Weyl spaces in which there exists a tensor  $b_{ij}$  being different from the measure tensor, which for a certain vector  $E_k$  satisfies the condition:  $b_{ij,k} = b_{ij}E_k$ . It is remarked that the reducible Weyl spaces with two one to another orthogonal systems of completely geodesic surfaces are no Riemannian spaces. For more than two systems of the above kind they are Riemannian spaces. After these preliminary remarks the results of the first part are generalized to the more-dimensional case. As an analogue of the geodesic net in  $A_2$ , in the  $A_n$  the notion of the geodesic cone field due to Sapiro (Doklady Akad. Nauk 39, 6-10 (1943)) is used. Some

Mat. Sbornik, n. Ser. 36, 169-200 (1955)

CARD 3/3

PG - 104

results of the first part then can be transferred completely: In order that (1) is the integral of the geodesic lines of the  $\Delta_n$ , it is necessary and sufficient that the tensors  $a_{ij}$  and  $b_{ij}$  and any linear combination of it represent geodesic conic fields of the  $\Delta_n$ . For the generalization of the results on special geodesic nets the notion of a projective-metric conic field is introduced. The tensor of this field satisfies the condition

$$na_{ij,k} = \frac{u}{2} (t_i a_{kj} + t_j a_{ki}) + (a_{\alpha\beta k} \tilde{a}^{\alpha\beta} - t_k) a_{ij},$$

where  $t_i$  is the Cebyshev vector of the conic field. Two conic fields with the same  $t_i$  are called special conic fields. By introduction of these new notions the remaining results of the first part can be transferred to the more-dimensional case.

TITLE: Weyl spaces containing a projective system of paths.  
(Prostranstva Veylyya, vkluchayushchie proyektivnyyu  
sistemu putey).

PERIODICAL: "Matematicheskiy Sbornik" (Mathematical Symposium),  
1957, Vol.41(83), No.2, pp.231-238 (U.S.S.R.)

ABSTRACT: The object of this paper is to review Weyl spaces  
which "include" a projective system of paths and to  
establish a relation between these spaces and reducible  
Weyl spaces. It appears that both these classes of  
spaces have a general subclass of spaces characterised  
in the following manner:-

A space of the subclass contains two mutually  
orthogonal systems of fully geodesic surfaces and one  
of these systems defines a geodesic field of  $m$ -dimensional  
directions in the space under investigation.

Consider a space of affine connectivity of  $n + m$   
dimensions  $A_{n+m}$ .  $m$  linearly independent vector fields  
 $V^a$  define in this space a certain field of  $m$ -dimensional  
directions. The  $m$ -dimensional field is called holonomic  
if the following conditions are satisfied:-

(1) Through each point  $A_{n+m}$  passes one of the  
spaces of the system, a

(2) The vectors  $V^a$  defining the direction of the  
field at a given point are tangent to the corresponding

Weyl spaces containing a projective system of paths. 199  
(Cont.)

subspace of the system. A holonomic field of  $m$ -dimensional directions is called geodesic if the manifolds of  $m + 1$  dimensions formed by the above subspaces passing through a point of any geodesic line of  $A_{n+m}$  are fully geodesic.

The conditions (14), (15) (see p.235) and (18) (p.236), are sufficient for the spaces  $W_{n+m}$  to include a projective system of paths. The geodesic projection of the space  $W_{n+m}$  by means of the coordinates of the manifolds  $v^i = \text{const.}$  ( $i = 1, 2, \dots, n$ ) on the manifolds  $v^a = \text{const.}$  ( $a = n+1, \dots, n+m$ ) is a system of paths.

If it is supposed that the  $n$ -dimensional manifolds (8) (p.234) are fully geodesic, then the space  $W_{n+m}$  would be a reducible Weyl space, but not a reducible space of the same general type because the  $(m+1)$ -dimensional manifolds of subspaces mentioned above, passing through points of an arbitrary geodesic line of the space  $W_{n+m}$  are fully geodesic. There are three references, all Russian.

TITLE: The Mechanical Properties of Cold Hardened Chromium-nickel-austenite Steel of the Type 18-8 at Low Temperatures  
(Mekhanicheskiye svoystva nagartovannykh khromonikelevykh austenitnykh stalei tipa 18-8 pri nizkikh temperaturakh)PERIODICAL: Nauchnyye doklady vysshyey shkoly. Metallurgiya, 1961,  
Nr 2, pp 217-220 (SSR)

ABSTRACT: The mechanical properties of stainless austenite steels of the type 18Ni3No and 18Ni3N9T were investigated at temperatures of +20 and -195° after rolling at room temperature (Fig 1). The dependence of the relative extension of the austenite steel of the type 18-8 on different temperatures is given in figure 2. The higher plasticity of the austenite steels determined at 183° after rolling at +20° is caused by the occurrence of cubic face-centered lattices. The mechanical properties of the metals and alloys after the treatment under pressure at room temperature are summarized in the table. The transformation of martensite into austenite steel during the deformation process at low temperature increases the strength of the alloys. A previous cold working

Card 1/2

The Mechanical Properties of Cold Worked Chromium-Nickel-Austenite Steel of the Type 11-9 at Low Temperatures

is excellent for the use of austenite steel for low temperatures since the flow limit is thus increased without reduction of the plasticity. There are 2 figures, 1 table, and 4 references, 4 of which are Soviet.

AUTHOR. Pisareva, V.V. SCV 7717, 17-12  
TITLE On the Variation of the Intensity of Radio Emission in Intense  
on Corona Nonuniformities  
PERIODICAL Astronomicheskiy zhurnal, 1959, Vol. 36, No. 5, pp. 427-433 (USSR)  
ABSTRACT For the investigation of the intensity fluctuations of the solar radio emission from September 15 to November 1, 1957 in Irkutsk and Irkutsk simultaneous observations were carried out (the towns have nearly the same latitude and are at a distance of ~5000 km from each other). It was conjectured that in this manner a timely shift of the diffraction image of ~10 sec can be asserted; that would confirm the assumption that a part of the fluctuations of solar radio emission can be attributed to the diffraction of the radiation at the aeronal nonuniformities. But the conjecture was not confirmed. It is shown that for the confirmation of the mentioned shift a 10 times greater antenna surface ( $200 m^2$ ) and a more sensible apparatus would be necessary. As another possibility for the investigation of the nonuniformities of the corona the author recommends the measurement of the intensity of the radio emission of the Crat nebula, when this nebula is covered by the solar corona. It is shown that it.

AUTHOR: Pisareva, V V

TITLE: On the limits of applicability of the method of continuous perturbations as applied to the propagation of radiation through a medium with irregularities

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy,  
Radiofizika 1961 Vol.4 No.2. pp. 376-377TEXT: The limits of applicability of the method of continuous perturbations were discussed in a previous paper by the present author (Ref. 1: Akust zh. Vol.6, 87 (1960)). It is stated that the method used in that paper is not sufficiently correct. However present note, leads to exactly the same results as those given in Ref. 1. In particular it is shown that, when  $D \ll 1$ .

$$\frac{\alpha^2 |\psi_2|}{\alpha \sqrt{|\psi_1|^2}} = \sqrt{\frac{\sqrt{\pi} L^3 \mu^2}{i^3}} \approx 0.6 \quad \sqrt{[\ln(A/A_0)]^2} \ll 1$$

X

Card 1/3

On the limits of applicability of . . . S/141/61/004/002/016/017  
EO32/E114

and

$$\frac{a^2 |\psi_2|}{a \sqrt{\psi_1^2}} = \sqrt{\frac{\sqrt{\pi}}{2} k_0^2 \ell L \mu^2} \approx 0.7 \sqrt{(\alpha \psi_1)^2} \ll 1$$

when  $D \gg 1$ . In these expressions  $D = 4L/k_0 \ell^2$ ,  $L$  is the range,  $k_0$  is the wave number in vacuum,  $\ell$  is the average dimension of the irregularities in the medium,  $a = \sqrt{\mu^2}$ ,  $\mu$  is the average variation in the refractive index (measured from the mean) and  $a\psi_1$  and  $a^2\psi_2$  are the first terms in the expansion for  $\psi$  in powers of the small parameter  $a$ . Furthermore  $A$  and  $A_0$  are the amplitudes of the perturbed and unperturbed waves (cf. Ref. 1). It is argued that the condition for the applicability of the method of continuous perturbations, namely

$$\sqrt{[\ln(A_1/A_0)]^2} \ll 1, \quad D \ll 1,$$

is necessary and sufficient.

TITLE: Study of the inhomogeneities of electron concentration in the ionosphere in  
the region of the Tycho ocean with the help of artificial earth satellite signals

SOURCE: Geomagnetizm i aeronomiya, v. 5, no. 3, 1965, 423-428

TOPIC TAGS: electron, ionosphere, artificial satellite, antenna/ Explorer VII  
satellite, N 10 oscilloscope

ABSTRACT: The longitudinal dependence of the index of fluctuation of the signal  
from the artificial satellite Explorer-VII in the range of latitudes from 41°N to  
18°S was studied. The correlation between the index of fluctuation, the diffuseness  
of the F-2 layer, and the frequencies of occurrence of E<sub>s</sub> has been established. The  
diurnal dependence of the index of fluctuation and its relation to the magnetic  
activity are briefly considered and the magnitudes of the inhomogeneities are esti-  
mated. The frequency of the signal from the satellite was 19.992 megacycles. The  
authors were interested only in observing signals of relatively large wavelengths,  
 $\lambda \sim 15\text{m}$ . The signal was received by half-wave dipole antennae at an altitude of  
0.5 m above the deck of the vessel. After detection, the signal was sent through an  
Card 1/2

L 52187-65

ACCESSION NR: AP5014102

integrating network having a time constant of 0.02 sec, and was registered on an N-10 oscilloscope. The data about the ionosphere were obtained in an AIS station. The diffraction pattern on the earth's surface was obtained, and the following formula was used for  $\tau$ , the time for irregular changes in the signal in the Fraunhofer region.

$$\tau = \frac{\Delta \xi}{v \sqrt{(\Delta \phi)^2 / h_1}} \cdot (h = h_1 h_2 / (h_1 + h_2)).$$

Here  $\Delta \xi$  is the size of the inhomogeneity,  $v$  the velocity of the satellite,  $\Delta \phi$  the phase shift due to the inhomogeneity,  $h_1$  the altitude of the inhomogeneity, and  $h_2$  the altitude of the satellite. It was found from these observations that the index of fluctuation at night did not have a maximum in time. In most cases it was found to be well correlated to the diffuseness of the F-2 layer. The coefficient of correlation was found to be 0.16. Orig. art. has: 3 figures and 2 formulas.

TITLE: Several results of investigations of E<sub>s</sub> layers in the <sup>B</sup> region of the Pacific

SOURCE: Geomagnetism i aeronomiya, v. 4, no. 5, 1964, 866-872

TOPIC TAGS: ionospheric sporadic layer, appearance frequency, local time, E<sub>s</sub> layer type, semitransparency

ABSTRACT: Investigations of ionospheric sporadic E<sub>s</sub> layers were carried out over the Pacific between the latitude parallels 42°N and 18°S in the summer of 1962. The whole region was divided into three zones — zone I, equatorial; zone II, northern tropical; and zone III, northern subtropical. E<sub>s</sub> types c, l, f, s, and q were analyzed. The maximum appearance frequency of the f-type took place between 2 and 3 p.m. local time. The c-type had a minimum appearance at noon. The l-type had a minimum at 2 p.m. These charac-

Card 1/2

L 11369-65

ACCESSION NR: AP4046283

Characteristics relate to zone I. With increased latitude, the maximum of the appearance frequency is transferred to the night hours. The maximum appearance frequency of the l-type takes place in zone II. A maximum reflection from the l-type was observed near the equator. Some of the E<sub>s</sub>-types totally screen the reflection of upper ionospheric layers, and others are semitransparent, depending upon their structures. The f-type is opaque at night. Orig. art. has 5 figures.

TITLE: Latitudinal distribution of absorption of cosmic radio emission in the ionosphere

49

SOURCE: Geomagnetizm i aeronomiya, v. 5, no. 1, 1965, 173-177

48

TOPIC TAGS: cosmic radio emission, radio wave absorption,  
ionospheric F2 layer, ionospheric D layer

B

ABSTRACT: This paper presents the results of measurements of absorption of cosmic radio emission made over the Pacific Ocean in the range of latitudes 36°N-18°S in the summer (May-August) of 1962 (between longitudes 160-240°E). Measurements were made by the two-frequency method. Fig. 1 of the Enclosure shows the mean diurnal curves of ionospheric absorption at a frequency of 22 Mc for each range of latitudes. All the diurnal curves have a characteristic maximum in the afternoon hours, and in some cases there is a small evening maximum whose nature is not clear. The latitude dependence  $\Sigma$  of total radio wave absorption in the ionosphere is shown in Fig. 2. Total absorption increases with a decrease in latitude, but in the region of the geomagnetic equator there is a noticeable maximum. The absorption

Card 1/4

L 34494-65  
ACCESSION NR: AP5005199

maxima are at geographic latitudes of approximately 16°N and 11°S. The illustrated dependence of total ionospheric radio absorption on latitude indicates that there is a clearly expressed geomagnetic effect in the latitudinal distribution. For comparison, curve d in Fig. 2 shows the dependence of the critical frequency of the F2 layer for hours close to midday. Data on  $f_0F2$  were obtained at the same time. The relationship between total absorption and  $f_0F2$  indicates that the F2 region makes an appreciable contribution to total ionospheric absorption. On the basis of the determined latitudinal distribution of absorption of cosmic radio emission and the values  $f_0F2$ , an attempt is made to detect the contribution  $\int_F$  to the total absorption  $\int_t$  introduced by the F2 region and the contribution  $\int_D$  introduced by the lower regions of the ionosphere, particularly the D layer. The latitude dependence of absorption in the F2 layer  $\int_F$  and absorption in the lower ionosphere  $\int_D$  are shown in Fig. 2 of the Enclosure. Orig. art. has: 11 formulas, 2 figures and 1 table.

TABLE OF  
CONTENTS:

Isayeva, Ye. N. Nature of Errors in Weather Forecasting  
in the Summer of 1954

3

In 1954, weather forecasting in Moskovskaya Oblast' fell short of expectations, being correct to only 73.5 percent as against a 72 percent average for the entire year. The author examines each individual cause of error and concludes that precipitation, temperature, and especially errors in forecasting the baric field of a low gradient were the deciding factors in faulty predictions. The author explains how incorrect analysis of air stratification or one of developing fronts affects the forecasting. There are 3 tables and no references.

Bachurina, A. A. Analysis of the Incorrect Weather Forecast  
for May 31, 1954.

9

Card 2/8

## Problems in Sinoptic Meteorology

360

The forecast for this particular date was rain at night and cool during the day. The prediction was based on the observed cyclogenesis by night (and early in the morning) on May 30. The enclosed maps show: 1) weather conditions at 3 o'clock a.m. on May 30 2) thermal and baric conditions at 6 o'clock a.m. on May 30 3) forecast for 3 o'clock a.m. for May 31 4) actual weather situation at 3 o'clock a.m. on May 31. The prediction failed: there was no rain by night and the temperature on May 31 was 22° C. The error was due to incorrect forecasting of baric pressure; this is illustrated by two additional maps. There are 5 maps and no references.

## Mertsalov, A. N. Two Cases of Convective Rain

15

The article discusses two cases of erroneous weather prediction in Moskovskaya oblast' for July 29 and 30, 1954 due to convective rain. On July 28 in the evening, the prediction for the following day was no rain. This prediction was repeated the next morning. Nevertheless, it rained heavily with precipitation  
Card 3/8

Problems in Sinoptic Meteorology

360

mounting to 35.2 mm. The prognostics for July 30 read: scattered showers. In fact, it rained throughout the entire Moskovskaya oblast' with precipitation ranging from 8 to 18.9 mm. As a cyclone was moving westward covering the whole oblast, the rainfall was caused by convective instability. Because of an incorrect diagnosis of the baric field on the eve of the rainfall, the movement of the cyclone was not predicted in the forecast. There are 12 synoptic maps illustrating the above two cases and 3 Soviet references.

Isayeva, Ye. N. Analysis of the Erroneous Weather Forecast for July 28, 1954

31

The forecast for Moskovskaya oblast' for this date was rain. The error was caused by incorrect prediction of the movement of a cyclone approaching Moscow from the Baltic area. Two maps show the baric pressure near the surface and the thermal and baric situations on the morning of July 27. The author explains the mistake made in the analysis of this situation and shows how and why the expected cyclone by-passed Moscow. There are two synoptic maps, 1 table and no references.  
Card 4/8

Problems in Sinoptic Meteorology

360

Tomashevich, L. V. Analysis of the Erroneous Weather Forecast for May 2, 1954

35

The Moscow forecast for this date, confirmed on the morning of May 2nd read: partially cloudy, no rain, with daily temperature of 20 to 22°C. The error was caused by an unexpected retardation in the movement of two warm fronts from the South, which produced rain and with it a drop in temperature to 10°C. There are 3 synoptic maps and 2 Soviet references.

Bachurina, A. A. Analysis of the Incorrect Weather Forecast for June 26, 1954

40

The Moscow forecast for this date read: some cloudiness, no rain, daily temperature from 22 to 27°C. This was confirmed on the morning of June 26th. The error was due to incorrect evaluation of the factors causing precipitation. The capital was hit by torrential rains and the rain was persistent. Evolution of the zone of rain progressed from the direction of Card 5/8

Problems in Sinoptic Meteorology

360

Smolensk but this had not been foreseen by the forecast service.  
There are 6 figures, 2 tables and no references.

Gorodova, M. I. Storm on July 4, 1954

47

The storm was not predicted in the morning forecast for Moscow. The synoptic map for this day was made at 3 o'clock in the morning. Although a slowly moving anticyclone was expected to reach the area of Moscow some time in the afternoon, no immediate rain was predicted. Nevertheless, the storm came at 5:30 a.m. and lasted until 11 a.m. The storm resulted from instability produced by the advection of saturated air, while the adiabatic gradient created conditions for convective rain. There are 7 drawings, 2 tables and 3 Soviet references.

Card 6/8

Problems in Sinoptic Meteorology

360

Cherkasskaya, V. M. Torrential Rains in the Ridge of High Pressure on August 12 and 13, 1954

57

For August 13th the Moscow forecast read: no precipitation. However, the whole oblast was hit in the evening by torrential rains amounting to 30 mm in the capital. The prediction was based on the position of isallohypsal lines and on the calculation of the movement of a depression, the axis of which expected to be east of Moscow towards evening. The convective instability was created by adiabatic decrease in temperature at 500 millibar level and by the advection of colder air at a 700-850 millibar level. There are 8 figures and 1 Soviet reference.

Neronova, L. M. Distribution of Summer Precipitation in Moskovskaya Oblast'

67

Since the majority of incorrect weather predictions in 1954 in Moskovskaya oblast' concerned precipitation, the author  
Card 7/8

Problems in Sinoptic Meteorology

360

analyzes the total distribution of rainfall throughout the entire oblast from the point of view of both intensity and occurrence. The author refers to previous attempts by I.I. Kasatkin to sum up the distribution of rainfall in the area of Moscow. The article includes a map of all meteorological stations in the oblast and draws general conclusions as to the amount of rainfall from both frontal zones and air masses. In the appendix there are tables showing maxima of precipitation under various synoptic situations (ridge, cold front, anticyclone, depression, etc.) and a listing of average monthly rainfall observed at each station. There are 9 maps, 16 tables, and 6 Soviet references in the text and 5 tables in the appendix.

TABLE OF  
CONTENTS:

Duletova, T. A. and Komissarova, L. N. Relation Between Seasons and Rhythmicity 3  
The authors refer to B. P. Mul'tanovskiy's method of long-term forecasting as standard in the USSR. They also recapitulate the basic postulate of Mul'tanovskiy's theory that natural synoptic seasons and rhythmicity in atmospheric processes are interrelated. The article expands this theory. The authors suggest making an integrated map of depressions and ridges within a certain span of time. Such a map, compiled at AT 500 (absolute topography at the 500 millibar level), would automatically reveal all deformations in atmospheric processes and their deviation from some definite synoptic patterns. There are 3 tables, 14 maps, 2 diagrams, and 3 Soviet references.

Card 2/7

Transactions of the Central Institute of Forecasting

387

Vitel's, L. A. Solar Origin of Atmospheric Rhythms

22

The author examines the relationship between solar activity and atmospheric processes and draws the following conclusions: 1. Periods of intensified solar activity can neither be ascribed to definite areas nor can they be considered constant in their degrees of intensity. 2. Although rhythmic changes in atmospheric processes are dependent on variations in solar activity, yet similar solar effects do not always produce identical responses in atmospheric rhythms. The article mentions S. T. Pagava, K. V. Brodovitskiy, P. P. Predtechenskiy, B. M. Rubashev (Pulkovo Observatory), M. N. Gnevyshev (Pulkovo Observatory), M. S. Bygenson, V. G. Shishkov, and V. V. Shuleykin as the leading scientists in the field of studies of solar impact on atmospheric processes. There are 11 diagrams, 2 maps, and 26 references, of which 20 are Soviet, 1 is French and 5 are in English.

Isayev, E. A.

Investigation of a Sharp Decline in Temperature in European USSR Caused by Certain Synoptic Processes.

The author separates the occurrence of cold waves in synoptic processes of the moderate zone of European USSR into ultra polar, meridional and normal types and remarks on the role of the advection of cold air masses from the polar region.

Card 3/7

Transactions of the Central Institute of Forecasting

387

The first chapter of the article contains general information on the nature of cold waves, and a number of anticyclonic outbreaks travelling southwards is analyzed. The existence of monthly rhythmicity in all types of processes and its application in long-term forecasts is the subject of the second part of the article. In the third part the author compiles statistical data on air temperature during the first six months of the year for Moscow, Voronezh, Penza, and Vologda and he demonstrates the probability of recurrence and rhythmicity in such repetitions. The author defines the term "sharp" decline in temperature as a decline of the average daily temperature by 5° to 10°C during cold seasons and 3° to 7°C in warm seasons provided that such temperature lapse occurs within 1-2 days. The author concludes that in addition to seasonal rhythmicity there are also monthly rhythms of synoptic processes. The statistical data are to prove that a definite successive recurrence exists among the various types of air circulation and also in the location and distribution of baric fields. Consequently, the occurrence of certain types of synoptic situations during a given period will allow the prediction of definite synoptic situations in the non-distant future. There are 11 tables, 14 maps, and 5 Soviet references.

Card 4/7

Transactions of the Central Institute of Forecasting

117

Avanessova A. G., Kask L. I., and Yausheva G. Sh. Occurrence of Selected Ultrapolar Processes in Central Asia and Kazakhstan.

83

The authors evaluate the efficacy of long-term weather forecasts based on the periodic occurrence of ultrapolar processes. The latter are traced along their meridional extent from some definite reference points in the North, i.e., the Barents Sea, Novaya Zemlya, etc. In the appendix, 54 ultrapolar processes are analyzed and their reference localities specified. In addition, the tabular material specifies also the occurrence of respective synoptic phenomena consequent upon the appearance of polar air processes. The rhythmicity of recurrence is repeated in intervals of 3 to 5 months. There are 11 maps, 1 diagram, and 4 tables, in addition to 16 pages of tabular data in the appendix. All 7 references are Soviet.

Goncharova, Ye. F. Synoptic Conditions of the Exceptionally Cold Spring of 1952 in Northern Caucasus

117

The average daily temperature in March was 2° to 5°C below the norm and in April and May, 1° to 1.5°C. Similar conditions were observed during the springs of 1945, 1940, 1933, etc. The article analyzes these conditions. There are

Card 5/7

Transactions of the Central Institute of Forecasting

387

three main types of synoptic processes which can cause an unusually cold spring in this area: 1. The occurrence of an anticyclone in Scandinavia with a tendency to travel south. 2. The existence of a depression over the Soviet Northeast with the ensuing displacement of anticyclones towards the Caspian Sea. 3. The occurrence of a large depression over the northern half of European USSR and the constant advection of cold air into this depression. This depression has a tendency to extend as far south as the Black Sea. There are 3 maps, 1 diagram, and 1 Soviet reference.

Trofimov M. V. Problem of Rhythmicity in Ultrapolar Synoptic Processes in Siberia and the Far East

124

The article refers to B. P. Mu'tanovskiy's contribution to the interpretation of ultrapolar processes and their behavior. Mu'tanovskiy discovered that the recurrence of conditions can be observed every 3 to 5 months. In later years S. T. Pagava proved that there are also intermediate rhythms which repeat at intervals of 45-75 days. In the present article the author not only recapitulates the work of his predecessors but also describes the nature of such polar processes. The processes are traced from some definite reference points such as the Kara Sea, Kolyma, etc. The author explains the role of these processes

Card 6/7

Transactions of the Central Institute of Forecasting

387

in synoptic forecasts and their low reliability. The appendix contains data on synoptic processes which may be similar, different, or reversed with respect to their corresponding polar processes. There are 3 maps, 5 diagrams, 8 Soviet references, 5 tables, and a 9-page appendix.

PURPOSE This book is designed for the meteorologist specializing in synoptic meteorology.

COVERAGE: In 1953 the All-Union Conference of Synoptologists resolved to publish the selected works of P. I. Brounov (1852-1927), the founder of Russian synoptic meteorology. Brounov, whose works had never been published in one edition before, made important contributions in the fields of synoptic and agricultural meteorology, atmospheric optics, and physical geography. The present edition, Volume I, Synoptic Meteorology, contains only a part of his writings and consists of 10 works published between 1879-1921. The first nine contain the basic results of his research in synoptic meteorology; the tenth is a proposal

Card 1

Selected Works (Cont.) 793

for a reorganization of the forecasting service in Russia. The material for Volume I was selected from Brounov's earlier works. Volume I does not include material from his classic "Course in Meteorology" published in 1927, nor material from his "Temporary Barometric Maximums in Europe", which was almost wholly reproduced in a later work, "Barometric Maximums in Europe and Their Theory", and which is included in the present volume. Also included is the second part of his "Fundamentals of Weather Studies." One of Brounov's significant conclusions regarding the formation of barometric maximums was his recognition of 3 types of maximums. 1) constant maximums, 2) half yearly maximums, and 3) temporary maximums. In forming isobar maximums Brounov established that anticyclones, as well as cyclones, usually move in the direction of their greatest elongation. In examining the movement of anticyclones, he found that the center of the barometric maximum generally moves in the direction of the greatest temperature decrease. A biographical sketch and a detailed discussion of his works, theories, and experimental studies are given in the first two introductory chapters, and a complete biography of his writings at the end of the book acquaints the reader with works not included in this edition. The works are in chronological order. The text is accompanied by diagrams and tables.

TABLE OF CONTENTS

Foreword

Usmanov, R.F., Petr Ivanovich Brumov and His Contributions to  
Synoptic Meteorology

Anomalous Distribution of Temperature in Russia in 1857

Forward Movement of Cyclones and Anticyclones in Europe and Part of  
Russia

Introduction

Ch. I. Preliminary Investigation

Ch. II. Study of the Distribution of Temperature and Absolute  
Humidity in Cyclones

Ch. III. A New Theory of Movement

Card 3 9

Selected Works (Cont.) 753

- Ch. IV. The Relationship Between the Thermometric Gradient, Force, and Velocity of Cyclone Movement
- Ch. V. Some Outstanding Features and Subsequent Results of Investigations
- Ch. VI. Theory of Anticyclone Movement
- Ch. VII. Analysis of the Distribution of Temperature Deviations in the Normal Around Cyclone Centers
- Ch. VIII. Maps of Atmospheric Pressure Changes
- Ch. IX. Relationship Between the Path of a Cyclone, the Path of Maximum Temperature Deviation From the Normal, and the Path of Maximum Barometric Fall
- Ch. X. New Methods of Forecasting Storms

Conclusions

Card 4 9

Selected Works (Cont.) 753

Annual Rate of Temperature Deviations From the Normal in European Cyclones

European Storms and Their Prediction

Introduction

1. Synoptic maps and their compilation
2. Relationship between wind and the elasticity of air
3. Effect of the earth's rotation on moving air
4. Determining the earth's deflecting force
5. Buys Ballot's and Stephenson's laws
6. Barometric minimums and maximums; cyclones and anticyclones; the barometric gradient; storms
7. Determining the barometric gradient
8. Size and form of cyclones
9. Winds in a cyclone
10. The path of a particle of air in the lower parts of a cyclone; studies by Guldberg and Mohn
11. Surfaces of equal elasticity; ascending air currents
12. Phenomena accompanying cyclones

Card 5/9

Selected Works (Cont.) 753

13. Changes occurring in the condition of the atmosphere at a given place when a cyclone passes over. Dove's law and its explanation
14. Formation of cyclones
15. Conclusions regarding the conditions of equilibrium in air. Studies by Hann and Peslin
16. Barometer height at the center of a cyclone; forces of cyclones; their mechanical work
17. Dependence of the magnitude of the barometric gradient on the force of the wind
18. Direction and velocity of cyclone movements
19. Hypotheses of cyclone movement; Faye, Koppen, Andrews and Mohn
20. Distribution of temperature and humidity in cyclones
21. General forecasting of storms; the storm system in Russia

Barometric Maximums in Europe and Their Theory

Ch. I. Laws of Motion of Barometric Maximums

1. Three types of barometric maximums. Purpose of the investigation
2. Maps of the paths of maximums
3. Survey of maps by months
4. Direction and velocity of the forward motion of maximums

Card 6/9

Selected Works (Cont.)

753

Ch. II. Form of Barometric Maximums and Height of Barometer in the Center

5. Form of barometric maximums
6. Direction of greatest isobar elongation
7. Height of barometer in the center of maximums

Ch. III. Formation of Barometric Maximums

8. Two main systems in the formation of maximums and minimums: thermal and dynamic
9. Probable effect on the formation of maximums when cold air with a greater water vapor content is replaced by colder air with a smaller water vapor content
10. Remarks on other systems in the formation of maximums
11. Examples of thermal and dynamic formations of maximums
12. Formation of maximums in Europe, 1876-1879; maximums coming from other countries into Europe during the same period

Ch. IV. Causes of the Forward Movement of Maximums

13. Remarks on the theory of general currents
14. Temperature decrease in the area of the maximum

TITLE: High temperature lubricants based on dyes

SOURCE: AN SSSR. Nauchnyy sovet po troniyu i smazkam. Teoriya smazocheskogo doyavtviya i novyye materialy (Theory of lubricating action and new materials). Moscow, Izd-vo Nauka, 1965, 134-138

TOPIC TAOS: lubricant, dye based lubricant, lubricant additive/ TalATIM 221s lubricant, PFMS 4 silicone fluid, ETs 3 centrifuge, FML322/300 silicone fluid

ABSTRACT: Lubricants based on dyes which are stable up to 350°C were investigated. Polymethylphonyl-siloxane liquids with different methyl and phonyl group ratios (E.M. Oparina i dr. Khimiya i tekhnologiya topliv i masel, 1961, No. 1) were used as the dispersion media. It was found from the volumetric mechanical properties that vat dyes blue "K," indigo, dioxyviolanthrone, and dimethoxyviolanthrone have weak thickening properties while the other dyes (pigment "SA") vat dyes blue "N," "O," and isoviolanthrone) form lubricants which are similar in mechanical properties and colloidal stability to silicone lubricants (TalATIM-221s, for example). To

L 21032-68

ACCESSION NR: AT5020430

8

determine storage stability and high temperature stability, the lubricants were tested by the KSA method (350 gm load) and on heated centrifuge ETo-3 (at 150°C for 5 hours) respectively. It was found that with PFM3-4 fluid the colloidal stability of good thickening dyes was better than that of less effective thickeners and comparable to TALATIM-221a.<sup>11</sup> Percent weight loss of lubricant based on different fluids (using pigment SA) was found to be 3.0, 4.2, 6.3 and 11.0% at 250°C and 0, 17.1, 18.0 and 29.1% at 300°C for PFM3-4,<sup>12</sup> copolymer 2/300,<sup>13</sup> copolymer 3, and PML322/300 fluids respectively. It was also found that the plastic properties, i.e., effective viscosity and strength of isoianthrone-based lubricants (after heat stabilization), were practically unchanged after 1000 hrs at 150°C. Indanthrene and isoianthrone silicone lubricants were tested in ball bearings<sup>14</sup> at high speeds ( $N_n = 300\ 000$  mm rev/min) at 150°C and 15000 kg/cm<sup>2</sup> and were found inferior to TALATIM-221 lubricants. At lower speeds (to 10000 mm rev/min) and low loads the above lubricants operated longer than 1500 hours at 200°C. Dyes can be used as thickeners in conjunction with graphite<sup>15</sup> and molybdenum disulfide,<sup>16</sup> giving up to 2500 hrs of service at 200°C, 100 rpm, and 20000-25000 kg/cm<sup>2</sup> (lubricant NK-50<sup>17</sup> fails after 8-10 hrs under those conditions). At lesser speeds and loads service of 3000 hrs at 350°C can be obtained. Orig. art. has 4 tables.

Title : Temperature dependence of the damping of vibrations and the modulus of elasticity of some steels  
Periodical : Vest. mash. 34/8, 61-65, Aug 1954  
Abstract : An analysis is made of research conducted to ascertain the effect of heat on the damping of vibrations in machines with rapidly-moving parts. The materials involved were austenite steel, tool steel, parlite steel and high-chromium steel. Temperatures up to 1300° were used. Three Russian references: (1946-1953).
